Ecole Supérieure des Ingénieurs de Medjez El Bab (Tunisia)

➤ The Medjerda catchment area represents 37% of Tunisia's surface water and provides water for half the population.

➤ studies have shown that alterations in LULC have an impact on the availability of water resources and the hydrological cycle (Krause et al.,2008)

➤ Remote sensing (RS) and (GIS) are essential tools in obtaining accurate and timely spatial data of LULC, as well as analyzing the changes in a study area (Srivastava PK et al 2013).

# Objectives

**To model land use dynamics (historical and future) of the Siliana catchment in Tunisia**

**using stochastic GIS embedded LU dynamic model based on Markov Chain and Cellular Automata**

# The study area

**Location: NW of Tunisia**

**Surface area: 1028 Km<sup>2</sup>**

**Annual precipitation is 580 mm/yr**

**Main land use type : Cereals 64% of the catchment area**

**Major soil groups : Limestone and Luvisol (22% and 21,7%)**

# Data required: Satellite data

| <b>Period</b> | <b>Satellite and data type</b> | <b>Resolution (m)</b> |
|---------------|--------------------------------|-----------------------|
| <b>1990</b>   | <b>Landsat5,TM</b>             | <b>30</b>             |
| <b>2000</b>   | <b>Landsat5,TM</b>             | <b>30</b>             |
| <b>2010</b>   | <b>Landsat5,TM</b>             | <b>30</b>             |
| <b>2019</b>   | <b>Landsat8,OLI</b>            | <b>30</b>             |

# Data required: Biophysical data

| <b>Data type</b>      | <b>Date of production</b> | <b>Source</b>                   |
|-----------------------|---------------------------|---------------------------------|
| <b>Land cover map</b> | <b>2010</b>               | <b>Siliana Agricultural map</b> |
| <b>DEM</b>            | <b>2014</b>               | <b>SRTM</b>                     |
| <b>Precipitation</b>  | <b>Daily(2000-2010)</b>   | <b>DGRE</b>                     |

# Data required: Socio-economic data

| <b>Data type</b>       | <b>Date of production</b> | <b>Source</b>                   |
|------------------------|---------------------------|---------------------------------|
| <b>Population</b>      | <b>2000-2010</b>          | <b>Siliana Agricultural map</b> |
| <b>Settlement</b>      | <b>2000-2010</b>          | <b>Siliana Agricultural map</b> |
| <b>Road Network</b>    | <b>2000-2010</b>          | <b>Siliana Agricultural map</b> |
| <b>Railway Network</b> | <b>2000-2010</b>          | <b>Siliana Agricultural map</b> |

# Method: Supervised classification

## Preparing land use maps

# Method:CA-MC modelling

# Method: Markov Chain Analysis (MCA)

A **Markov model** is a stochastic model proposed by Russian mathematician Andrei Markov

The probability of moving from one state to another state is called **a transition probability**.

Transition Probability Matrix

$P = P_{ij} =$

|          |          |       |          |
|----------|----------|-------|----------|
| $P_{11}$ | $P_{12}$ | ..... | $P_{1n}$ |
| $P_{21}$ | $P_{22}$ |       | $P_{2n}$ |
| $P_{n1}$ | $P_{n2}$ |       | $P_{nn}$ |

where  $P$  = Markov transition probability matrix  
 $i, j$  = the land type of the first and second time period  
 $P_{ij}$  = the probability from land type  $i$  to land type  $j$

**The Transition Area Matrix** is produced by multiplying each column of the Transition Probability Matrix ( $P$ ) by number of pixels of corresponding class in the latter image.

# Method: Cellular Automata (CA) Model

A **cellular automaton** is a discrete model for modeling spatial dynamics.

$$S_{t+1} = f(S_t, N, T)$$

where  $S_{t+1}$  = State at time  $t+1$

$S_t$  = State at time  $t$

$N$  = Neighbourhood

$T$  = Transition Rule

**Ex. Von Neumann's Neighbor and Moore's Neighbor**

Transition rules: The evolution of each cell is affected by its own state and the state of its immediate neighbors to the left and right.

# Method: Transition suitability maps

Transition suitability implies the suitability of a cell for a particular land cover.

# Method: Suitability maps

Cereal cultivation

Olive plantation

Pasture

Irrigated land

Clear forest

Dense forest

Urban land

## Results: Accuracy assessment

| Land Cover Class        | 1990               |               | 2000               |               | 2010               |               | 2019               |               |

# Results: LULC dynamic(1990-2019)

Gains and losses between 1990 and 2019

Contributions to Net Change in CEREALS

Contributions to Net Change in OLIVE trees

Contributions to Net Change in Pasture

Contributions to Net Change in Dense forest

Contributions to Net Change in Clear forest

Contributions to Net Change in urban

Contributions to Net Change in irrigated area

Contributions to Net Change in water

# Results: CA-Markov simulation

Simulated LULC 2019

Observed LULC 2019

## Kappa

Poor agreement:  $< 0,20$

Fair agreement:  $0,20$  à  $0,40$

Moderate agreement:  $0,40$  à  $0,60$

Good agreement:  $0,60$  à  $0,80$

Very good agreement:  $0,80$  à  $1,00$

# Results:CA-Markov prediction

## Results:LULC future

# Conclusion

- ✓ The study has demonstrated the applicability of a stochastic model that combines Markov Chain (MC) and Cellular Automata (CA) model to model land use dynamics.
- ✓ The combination of Markov and CA was reasonably accurate for projecting future LULC since it produced a kappa coefficient over 60%.
- ✓ We can prepare the future watershed management plan on the basis of projected land use land cover of watershed dynamics by MC-CA model.

**Thank you**
